

Synthesis:

My one interviewee struggles going to sleep because he doomscrolls social media at night, thus hurting his eyes to the point where it takes a while for him to sleep. They usually shower in the night, and right after that goes straight on his phone. He goes on his phone a lot because he is usually very bored after he does his homework, chores, and classes. He doesn't go to school on Mondays and Wednesdays so he is very bored most of the time, so he goes on his phone to kill some time. He usually goes to the gym, so he is rarely looking at his phone unless he needs to change his music. There was nothing really that I was surprised about at all, however, the real problem is that he doomscrolls way too late at night, and he sleeps way too late at night.

How Might We:

Gap Sentence: They treat forgetting to sleep as an option until it is too late

Turn into an Action: Help people stop doomscrolling at night so you can get the best sleep you can

Wrap It: How might we help people calm people down at night so you can get good sleep?

Brainstorming:

- What if it wasn't a physical prop (app)
- What if it works instantaneously (right when you install)
- What if your screen dims down until your set sleep time occurs
- What if the app is free, but has optional paid system for extra features
- What if the app tracks sleep via a number rating (1-10)
- What if the app has a built-in ranked system
- What if the app had rewards after every sleep to incentivize sleeping at a good time
