

MVP

Core problem

- Reducing time doomscrolling at night to get the best sleep you can

Must-have features

- Adding a reminder to log off off your social media app
- Blocking access to social media at a time slot of your choosing (Twitter, Instagram, Reddit, etc.)
- A select screen of all of the social media apps and turn them on and off at your time slot
- A scroll wheel similar to the alarm feature on the Clocks app

Nice to have, but not MVP

- A “yellow screen” setting so you don’t hurt your eyes from night time doom scrolling
- A ranked leaderboard (against friends) to verse your friends to see who gets the best sleep
- A friend list (connects to contacts, social media friends; profile ID to send friend requests)
- Social media apps that are only available in certain countries are also represented, so everyone can use the app (i.e, Chinese TikTok)

Key assumptions to test

- Make sure that the automatic shut off feature actually turns off all of your social media apps you chose at the exact time slot you selected
- The scroll wheel feature has odd numbers for those who really want to turn their social media apps on 7:33 PM
- Make sure that the select social media apps screen has every kind of social media app (including dating apps, and community based apps like Reddit)
